

Attribute Nuker Plus

The essential cleanup utility for Autodesk Fusion developers and power users.

Introduction: The "Why" and "What"

We've all been there: you are developing a new Fusion add-in or testing a script. You run it a dozen times. Now your design file is stuffed with hidden data: `test_data_v1`, `debug_log_entry`, `temp_config_backup`, or leftover attributes from an add-in you uninstalled months ago.

Fusion doesn't provide a native way to see or delete these invisible "Named Values" (Attributes) that get attached to your design.

Attribute Nuker Plus is a lightweight Python script designed to solve this problem. It acts as a "Deep Clean" utility for your Fusion files.

- **Total Transparency:** Scans the entire active design to find every hidden attribute.
- **Surgical Precision:** View attributes in a table and select exactly which ones to delete.
- **JSON X-Ray:** Unique "X-Ray" tech detects if an attribute contains JSON data (like those used in **Changelog Sidecar** or **LiveConfig**) and lets you expand it to delete individual keys or list items without destroying the entire attribute.
- **Developer Companion:** Written specifically to assist in the development and testing of data-heavy tools like LiveConfig and Changelog Sidecar, allowing you to reset specific states without nuking your entire setup.

Installation

Unlike Changelog Sidecar or LiveConfig (which are Add-Ins), **Attribute Nuker Plus** is a **Script**. This means it only runs when you tell it to and doesn't run in the background.

Manual Installation

1. **Download:** Download the `AttributeNukerPlus` folder.
2. **Locate Scripts Folder:**
 - **Windows:** `%AppData%\Autodesk\Autodesk Fusion 360\API\Scripts\`
 - **Mac:** `~/Library/Application Support/Autodesk/Autodesk Fusion 360/API/Scripts/`
3. **Install:** Copy the entire `AttributeNuker` folder into that directory.
4. **Run:**
 - Open Autodesk Fusion.
 - Press `Shift+S` to open **Scripts and Add-Ins**.
 - Click the **Scripts** tab (not Add-Ins).

- Select **AttributeNuker**.
- Click **Run**.

Using Attribute Nuker Plus

The Nuke Dashboard

When you run the script, a modal dialog appears listing every attribute found in the design.

- **The List:** Attributes are listed with their Group, Name, Value, and the Parent Object they are attached to.
- **Smart Truncation:** Long text values are shortened for readability, but hovering over any value reveals the full text in a tooltip.

JSON X-Ray (The "Killer" Feature)

If the script detects that an attribute contains a valid JSON string (Dictionary or List):

1. **Expansion:** It automatically creates "Child Rows" underneath the main attribute.
 - **Dictionaries:** Shows every Key/Value pair.
 - **Lists:** Shows every Item by index.
2. **Selective Nuking:**
 - **Nuke the Root:** Check the main "Container" row to delete the attribute entirely.
 - **Nuke a Key:** Check a specific child row (e.g., `timestamp` or `settings_backup`) to remove just that piece of data while keeping the rest of the attribute intact.

This is critical for tools like **LiveConfig**, where you might want to delete a single "Snapshot" from the JSON storage without wiping out all your other saved configurations.

Tech Stack

For the fellow coders and makers out there, here is how Attribute Nuker Plus was built:

- **Language:** Python (Fusion API)
- **Interface:** Native Fusion Command Inputs (TableCommandInput)
- **Logic:** Recursive JSON parsing to handle both Dictionaries (`{}`) and Lists (`[]`) with safe index management (deleting from bottom-up to preserve indices).
- **Lifecycle:** Uses `adsk.autoTerminate(False)` to maintain a persistent dialog window despite being a single-run script.
